D4 Informatics Engineering

1   Questions

1. it is the key to encrypt data in laravel

2. using the php artisan key:generate

3. there are 4 Migration file for users, password resets, failed jobs, and personal access tokens

4. the function is used to create a column name 'created at' and 'updated at' to the table

5. it will return an unasign big integer data type

6. the former will make a column named 'id' as a primary key and the later will make a column with the name in the parameter as primary key, in this case level_id

7. it is used to create a unique index for the column

8. because the m_user needed to be asigned as a foreign key while the m_level dont because its the primary key that is automtically generated

9. the purpose of the hash class is to provide hashing capability to scramble a massage. it mean that the string '1234' is scrambled to kept the password confidential

10. the question mark is used as a placeholder value

11. to make sure that the primary key is not manipulated by anyone

12. Eloquent ORM because its easier to create and manipulate data
